

update!

new cruncher variant LZ49, crunch better (average 10%) when used with more data
bugfix both crunchers when match/literal length equal to 270+255*n
bugfix Z80 cruncher: wrong size displayed when using more than one bank
bugfix Z80 cruncher: almost infinite loop when last key end in the last 3 bytes, or end the data

Hi!

I wrote a new compression format, freely inspired by LZ4 format (thanks to Yann Collet again)
The few modifications suits well to the Z80
The format was designed and modified to fit the decompression routine
Now it's optimised for size and speed
The decompression routine fit in 83 bytes and there is an ultra-short version (you lose some Nops)
Crunching routine is a little slow as matchkey may have an unlimited length
I will release in a few weeks max a C source code if people want to cross-crunch

Here is the format

Token definition: *contains both literal and match length information*
4 high-bits: literal length 0-15
if length=15 then read one Literal length extended byte (value 0-255) and add to current literal length
if literal length extended byte=255 then read another one, etc.

4 low-bits: match length 0-15
if length=15 then read one Match length extended byte (value 0-255) and add to current match length
if match length extended byte=255 then read another one, etc.

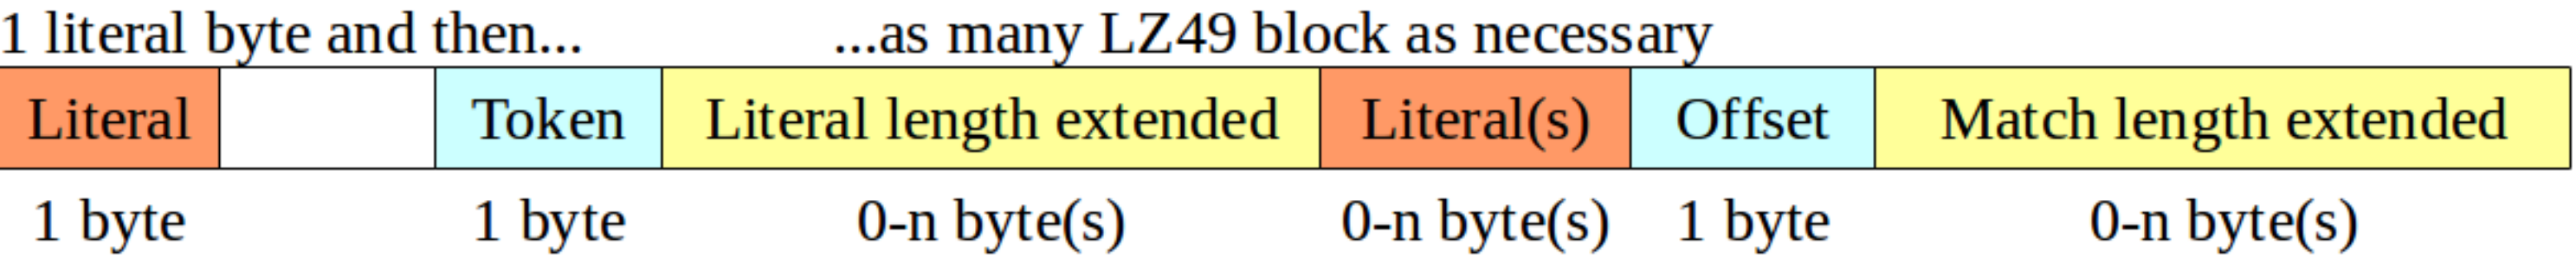

THEN add 3 to the final match length, because it is the minimal length

Offset definition: *absolute distance to match value -1*
if you want to copy from previous byte, then offset value is 0
if you want to copy 5 bytes far, then offset value is 4
if you want to copy 255 bytes far, then offset value is 254
if you want to END the file, then offset value is 255

I will release soon (don't know when) a C source file with an brutforce key search, design to run in a computer with moar memory 😊

You may play with crunching/decrunching routine

The crunching routine read data to compress from central memory and put compressed data in extension C4/C5/C6/C7

Changes:

1st high-bit of token is an extra offset range (set when offset>255)
